## Ytria acLEZ

### Better Domino ACL security administration

- Analyze ACLs on a Domino server with greater efficiency
- Solve your Notes ACL issues faster and easier than ever before
- Extends the power of Domino Administrator

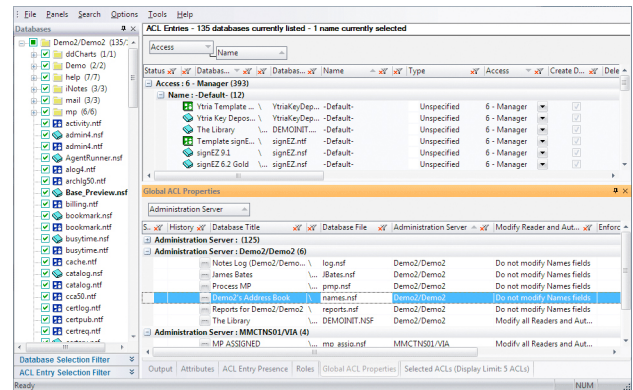

**acLEZ** Access Control List management is simple enough if your organization is tiny and unchanging with no important data to protect. But in the real world, Notes-based organizations have a large number (often hundreds) of databases on many servers, coupled with a unique and complex mesh of security requirements.

Managing an organization's ACLs manually is a tedious, time-consuming activity that's prone to serious human error like security loopholes or errant access denial.

### The solution for better Domino ACL security administration

Ytria acLEZ is the solution for better Domino ACL security administration. Here's what it lets you do:

- Get a bird's-eye view of global server security instantly—rather than spending hours poring over hundreds of ACLs individually—thanks to its powerful ACL diagnostics features
- Find and close any security hole instantly. Imagine if an administration error gave unfettered access to a highly sensitive database—these things do happen, but acLEZ lets you spot these problems and fix them immediately
- Expand your administration capabilities—superior tools let you tune security in ways that are just not possible using the native Domino administration toolset
- Powerful mass-modification features help you maintain consistency across your organization's ACLs

Check all global ACL properties—and change them
