Ytria databaseEZ

The server-wide NSF property manager for Lotus Notes and Domino

- Faster access to serverwide NSF properties
- Unbeatably comprehensive database information
- Superior mass-editing tools

Think your administration toolkit is good enough? Think again ...

Lotus Notes database properties are integral to the security, performance and functionality of a Domino Server. Unfortunately the native toolkit shows only limited NSF property information from a server perspective—and this data can take a long time to load.

Even worse, there are few native options for changing global NSF properties. Even where it's possible to modify several files' properties at a time, you get neither status information nor confirmation of changes.

At last! A global database property manager for Domino servers

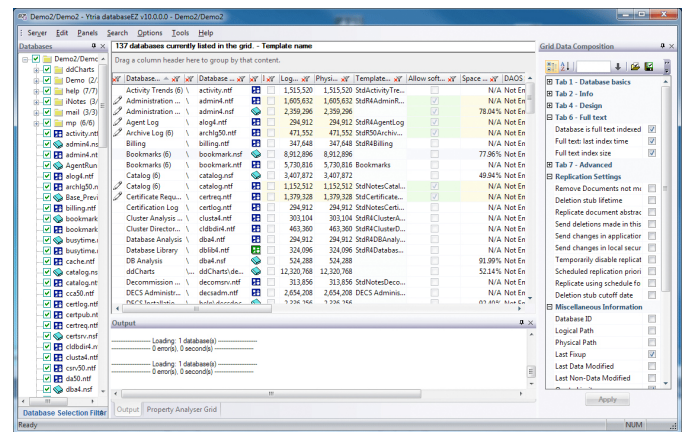

Ytria databaseEZ gives you:

- Faster access to serverwide NSF properties. Why wait? With databaseEZ, most critical database properties (including settings for Inheritance/Templates; Soft deletion; DAOS and much more) are shown nearly instantly. And because summarized data is used, many properties are visible even for databases you can't access.

- Unbeatably comprehensive database information See nearly 100 different NSF properties in databaseEZ's customizable grid—the native toolkit only shows 21 properties. With databaseEZ you can

see everything you need to know about the global NSF settings in your Domino environment—things like: Template inheritance settings; Soft deletion settings; DAOS properties; User activity information; Usability properties like 'Show in 'Open Application' dialog' flags; Advanced options—many of which have a great impact on performance; Security options like 'Don't allow URL open'; and much more...

- Superior mass-editing tools Make changes to properties across a Domino server with the confidence of knowing that you're seeing exactly what you're changing—plus get instant verification of results. And Full Access Administration is fully supported.
- And much more... Including: Serverwide property analysis; Template name mass-editing; Flexible data export options; Audit or sign databases (requires signEZ); Tight integration with other Ytria tools as well as the Domino Designer and Lotus Note clients; A fully customizable user interface
